

Beach Drive Coastal Resiliency Project

The week of April 20th, Michels moved their heavy equipment into the southern area of the Beach Drive project site. With the equipment in place, they were able to begin March 27th removing the concrete rubble from the site. Some larger armor stone to be used to protect the shoreline was delivered to the job site and will be used for the toe along the southern section of Beach Drive. This stone is currently being placed near the Mary Knoll property. Michels will continue work moving north along the project site.
